Think Haussmann !

How to create space for ecosystem services in overcrowded cities?

- Analysis of several ecological restoration projects at the scale of a city
- Different needs but same result: recovery of nature by citizens rather than deep ecological restoration
- Actors' role with its pressures and criticisms clearer over time
- With global warming, different partnerships have to be considered to integrate nature, its ecosystem services and make cities resilient to climate events
- But who? How? And with what funding?
